**1. Abstract:**

Determining the cyclic decomposition of the abelian factor group  $AC(G) = (G)/T(G)$ , where  $G = Q_{2m} \times C_7$ ,  $m=r_1.r_2$ , so that  $r_1, r_2 \neq 2$ ,  $r_1, r_2$  are prime numbers and the greatest common denominator( $r_1, r_2$ )=1 is the primary objective of the study. the group of all Z-valued characters of  $G$  over all cyclic subgroups of the group of induced unit characteristics of  $G$ .

12

We find that  $AC(Q_{2m} \times C_7) = \bigoplus_{i=1}^{12} C_2$ .

**Key words:** Cyclic group, Quaternion group, prime number and odd number

**2. Introduction:**

Representation theory delves into the study of abstract algebraic structures by portraying their elements as transformations of vector spaces, often using matrices to elucidate algebraic operations. In the realm of finite groups, members are typically depicted via invertible matrices, thereby aligning group operations with matrix multiplication. This branch boasts applications across various disciplines, including physics, chemistry, and other realms of mathematics. The Artin cokernel, denoted  $AC(G)$ , is pertinent to finite groups and delineates the factor group  $(G)/T(G)$ , where  $T(G)$  denotes the center of group  $G$ .  $AC(G)$  manifests as an abelian group, generated by the Z-valued characters of  $G$ .

**3-Preliminaries (3.1) - [2]**

Defined for a positive integer  $m \geq 2$ , the  $Q_{2m}$  Generalized Quaternion Group is shaped by generators  $x$  and  $y$ , expressed as  $Q_{2m} = \langle x^k, y^l : 0 \leq k \leq m-1, k=0,1 \rangle$ . This group, having an order of  $4m$ , adheres to  $x^{2m}=y^4=I$  and  $yx^ky^{-1}=x^m$ . Within finite group  $G$ , Artin characters, induced by a principal character in a cyclic subgroup, are structured in the Artin characters table  $Ar(G)$ . This table unfolds with rows detailing  $\Gamma$ -conjugate classes, elements in each class, centralizer size  $|CG(CL_{\text{all}})|$ , and successive rows presenting Artin character values.

**Definition (3.2)**

The group  $Q_{2m} \times C_7$  is the direct product group of the quaternion group  $Q_{2m}$  of order  $4m$  and the cyclic group  $C_7$  of order 7, then the order of The Group  $Q_{2m} \times C_7$  is  $28m$ .

**Theorem(3.3): [3]**

When  $s$  is a positive integer number and  $r$  is a prime number, the general form of the Artin characters table of  $C_{rs}$  is given by:-

$$Ar(C_{rs}) =$$

$\Gamma$ -classes	[1]	$[x^{r^{k-1}}]$	$[x^{r^{k-2}}]$	$[x^{r^{k-3}}]$	...	[x]

#### Theorem (Artin's) (4.10):[8]

Every rational valued character of  $G$  can be written as a linear combination of Artin characters with coefficient rational numbers.

#### Remark (4.11): [6]

Let  $l$  be the number of all distinct  $\Gamma$ -classes of  $G$  then  $Ax(G)$  and

$\Xi(G)$  are of rank  $l$ . According to the Artin's theorem there exists an invertible matrix  $U^{-1}(G)$  with entries in  $\mathbb{Q}$  such that :

$$\Xi(G) = U^{-1}(G) Ax(G) \text{ and this implies, } U(G) = Ax(G) \cdot (\Xi(G))^{-1}$$

$U(G)$  is the matrix expressing the  $T(G)$  basis in terms of the  $\bar{R}(G)$  basis. By Theorem (4.5), there exist two matrices  $B(G)$  and  $E(G)$  with determinant  $\pm 1$  such that:

$B(G) \cdot U(G) \cdot E(G) = \text{diag} \{d_1, d_2, \dots, d_l\} = D(G)$  where  $d_i = \pm D_i(G)/D_{i-1}(G)$  This process yields a new basis for  $T(G)$  and  $\bar{R}(G)$ ,  $\{v_1, v_2, \dots, v_l\}$  and  $\{u_1, u_2, \dots, u_l\}$  respectively, with the property  $v_i = d_i u_i$ . Hence, by Theorem (4.7) and Proposition (4.8) the  $\mathbb{Z}$ -module  $AC(G)$  is the direct sum of cyclic sub modules with annihilating ideals  $\langle d_1 \rangle, \langle d_2 \rangle, \dots, \langle d_l \rangle$ .

#### Theorem (4.12):[6]

$$AC(G) = \bigoplus_{i=1}^l C_{d_i} \text{ where } d_i = \pm D_i(G)/D_{i-1}(G) \text{ and } l \text{ is the number of all distinct } \Gamma\text{-classes of } G.$$

#### Corollary (4.13):[6]

$$|AC(G)| = |\det(U(G))|.$$

#### Lemma (4.14):[6]

**Proposition(4.16): [6]**

Which is order  $(s+1) \times (s+1)$  square matrix.

**Proposition(4.18): [10]**

The general form of matrices  $B(C_{r^s})$  and  $E(C_{r^s})$  are :

$$B(C_{r^s}) = \begin{bmatrix} 1 & -1 & 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 1 & -1 & 0 & 0 & \dots & 0 & 0 \\ 0 & 0 & 1 & -1 & 0 & \dots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 0 & \dots & 1 & -1 \\ 0 & 0 & 0 & 0 & 0 & \dots & 0 & 1 \end{bmatrix}$$

which is  $(s+1) \times (s+1)$  square matrix.

$E(C_{r^s}) = I_{s+1}$ ,  $I_{s+1}$  is an identity matrix and  $D(C_{r^s}) = \text{diag}\{1, 1, \dots, 1\}_{s+1}$ .

**Remark (4.19): [10]**

In general if  $m=r_1^{\alpha_1}.r_2^{\alpha_2} \cdots \cdots r_n^{\alpha_n}$  where greatest common denominator  $(r_i, r_j)=1$ . if  $i \neq j$  and for all  $i, j \leq i \leq n$ ,  $r_i \neq 2$  are prime numbers and  $\alpha_i$  any positive integers is all  $i = 1, 2, \dots, n$ , then :  
 $C_m = C_{r_1^{\alpha_1}} \times C_{r_2^{\alpha_2}} \times \dots \times C_{r_n^{\alpha_n}}$ .

1- By Proposition (4.17) we get:  $r_1 \neq 2$

$$U(C_m) = U(C_{r_1^{\alpha_1}}) \otimes U(C_{r_2^{\alpha_2}}) \otimes \dots \otimes U(C_{r_n^{\alpha_n}}).$$

Thus, we can write  $U(C_m)$  as:

$$U(C_m) = \begin{bmatrix} & & & & 1 \\ & R(C_m) & & & 1 \\ & & & & 1 \\ & & & & \vdots \\ 0 & 0 & 0 & \dots & 0 & 1 \end{bmatrix}$$

Where  $R(C_m)$  is the matrix which is obtained by omitting the last row

$\{0, 0, 0, 1\}$  and the last column  $\{1, 1, \dots, 1\}$  from the Tensor product.

$U(C_{r_1^{\alpha_1}}) \otimes U(C_{r_2^{\alpha_2}}) \otimes \dots \otimes U(C_{r_n^{\alpha_n}})$ . Where  $U(C_m)$  is of order,

$[(\alpha_1+1)(\alpha_2+1)\dots(\alpha_n+1) \times (\alpha_1+1)(\alpha_2+1)\dots(\alpha_n+1)]$  square matrix.

2- By Lemma (4.15) we have

$$a \cdot B(C_m) = B(C_{r_1^{\alpha_1}}) \otimes B(C_{r_2^{\alpha_2}}) \otimes \dots \otimes B(C_{r_n^{\alpha_n}}).$$

$$b \cdot E(C_m) = E(C_{r_1^{\alpha_1}}) \otimes E(C_{r_2^{\alpha_2}}) \otimes \dots \otimes E(C_{r_n^{\alpha_n}}).$$

**Proposition (4.20):[2]**

If  $m=r_1^{\alpha_1} \cdot r_2^{\alpha_2} \cdots \cdot r_n^{\alpha_n}$  where  $\alpha_i$  any positive integers if  $i \neq j$ ,  $r_i$ 's are prime numbers and greatest common denominator  $(r_i, r_j)=1$  then the matrix  $U(Q_{2m})$  of the quaternion group  $Q_{2m}$  is :

$$U(Q_{2m}) = \left[ \begin{array}{c|ccccc|ccccc} & & & & 1 & & & & & 1 \\ & 2R(C_m) & & & 1 & & 2R(C_m) & & 1 & 1 \\ & & & & \vdots & & & & \vdots & \vdots \\ & & & & 1 & & & & 1 & 1 \\ \hline 0 & 0 & \dots & 0 & 1 & 0 & 0 & \dots & 0 & 1 & 1 \\ & & & & 1 & 0 & 0 & \dots & 0 & 1 & 0 \\ & 2R(C_m) & & & 1 & 0 & 0 & \dots & 0 & 1 & 0 \\ & & & & \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots \\ & & & & 1 & 0 & 0 & \dots & 0 & 1 & 0 \\ \hline 0 & 0 & \dots & 0 & 1 & 0 & 0 & \dots & 0 & 1 & 0 \\ 1 & 1 & \dots & 1 & 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{array} \right]$$

Which is  $[2(\alpha_1+1) \cdot (\alpha_2+1) \cdots (\alpha_n+1)+1] \times [2(\alpha_1+1) \cdot (\alpha_2+1) \cdots (\alpha_n+1)+1]$  square matrix.

$R(C_m)$  is similar to the matrix in Remarks (4.19).

**Proposition (4.21):[2]**

If  $m=r_1^{\alpha_1} \cdot r_2^{\alpha_2} \cdots \cdot r_n^{\alpha_n}$  where greatest common denominator  $(r_i, r_j)=1$ , if  $i \neq j$  and  $r_i$ 's are prime numbers and  $\alpha_i$  any positive integers, then the matrices  $B(Q_{2m})$  and  $E(Q_{2m})$  are taking the forms :

$$B(Q_{2m}) = \left[ \begin{array}{c|c|c} S(C_n) & -S(C_n) & 0 \\ \hline 0 & 0 & 0 \\ 0 & 0 & 0 \\ \vdots & \vdots & \vdots \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ \hline 0 & 0 & 0 \end{array} \right] \quad \left[ \begin{array}{c|c|c} 0 & 0 & 0 \\ \hline 0 & 0 & 0 \\ 0 & 0 & 0 \\ \vdots & \vdots & \vdots \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ \hline 0 & 0 & 0 \end{array} \right]$$

Where  $k = (\alpha_1 + 1) \cdot (\alpha_2 + 1) \cdot (\alpha_3 + 1) \cdots (\alpha_n + 1) - 1$ . They are  $[2(\alpha_1 + 1) \cdot (\alpha_2 + 1) \cdots (\alpha_n + 1) + 1] \times [2(\alpha_1 + 1) \cdot (\alpha_2 + 1) \cdots (\alpha_n + 1) + 1]$  square matrix.

## 5. The Main Results

In this section, we give the cyclic decomposition of the factor group  $AC(Q_{2m} \times C_7)$  when  $m=r_1 \cdot r_2$ ,  $r_1, r_2$  are primes numbers, greatest common denominator( $r_1, r_2$ ) = 1 and  $r_1, r_2 \neq 2$

### Theorem (5.1):

If  $m=r_1 \cdot r_2$ ,  $r_1, r_2 \neq 2$  Where greatest common denominator ( $r_1, r_2$ ) = 1 and  $r_1, r_2$  are primes numbers, then the matrix  $U(Q_{2m} \times C_7)$  of the group  $Q_{2m} \times C_7$  is :

$$U(Q_{2m} \times C_7) = \left[ \begin{array}{c|c} U(Q_{2m}) & U(Q_{2m}) \\ \hline 0 & U(Q_{2m}) \end{array} \right]$$

where  $4(1+1)(1+1)+2=18$  Which is  $18 \times 18$  square matrix.

$(Q_{2m})$  is similarity the matrix of Proposition (4.20)

### Proof:

By definition of  $U(G)$  we find the matrix  $U(Q_{2m} \times C_7)$  :

$$U(Q_{2m} \times C_7) = \det(Q_{2m} \times C_7) \cdot (\det(Q_{2m} \times C_7))^{-1} =$$

where  $4(I+I) \underline{(I+I)} + 2 = 18$  Which is  $18 \times 18$  square matrix.

$$= \begin{bmatrix} U(Q_{2m}) & U(Q_{2m}) \\ 0 & U(Q_{2m}) \end{bmatrix} = U(Q_{2m} \rtimes C_2)$$

### Example(5.2):

When we take the matrix  $L(Q_{10} \times C_7)$  using two methods:

First:

*By definition of  $U(G)$*

$$U(O_{2,0} \bowtie C_2) = U(O_{2,3,5} \bowtie C_2) = Ax(O_{2,3,5} \bowtie C_2) - (\equiv^*(O_{2,3,5} \bowtie C_2))^{-1}$$

18×18 square matrix.

### Proof:

Using theorem (5.1) we get in the form of  $U(Q_{2m} \times C_7)$ . and in the above model form  $B(Q_{2m} \times C_7)$  and  $E(Q_{2m} \times C_7)$  then:

$B(Q_{2m} \times C_7) \cdot U(Q_{2m} \times C_7) \cdot E(Q_{2m} \times C_7) = \text{diag}\{2, 2, 2, 2, 2, 2, 2, 1, 1, 1, 1, 1, 1\} = D(Q_{2m} \times C_7)$

Which is 18×18 square matrix.

Example(5.4)

To get the matrices  $B(Q_{2,3,5} \rtimes C_7)$  and  $E(Q_{2,3,5} \rtimes C_7)$  by proposition (4.21) to find  $B(Q_{2,3,5})$  and  $E(Q_{2,3,5})$ :

$$B(Q_{2,3,5}) = \begin{bmatrix} 1 & -1 & -1 & 1 & -1 & 1 & 1 & -1 & 0 \\ 0 & 1 & 0 & -1 & 0 & -1 & 0 & 1 & 0 \\ 0 & 0 & 1 & -1 & 0 & 0 & -1 & 1 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 1 & -1 & -1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

$$E(Q_{2,3,5}) = \begin{bmatrix} 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & -1 & -1 & -1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & -1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Then by proposition (5.3)

$$B(Q_{2,3,5} \rtimes C_7) = S \cdot \left[ \begin{array}{c|c} 0 & B(Q_{2,3,5}) \\ \hline B(Q_{2,3,5}) & -B(Q_{2,3,5}) \end{array} \right] =$$
